

## Silver F.A.Q.'s

The following is a list of our most frequently asked questions. This brief question and answer section may hold the answers to YOUR questions. We have also provided a section with more in-depth information, a Special Report about Colloidal Silver where it's history, uses, and medical studies are discussed.

---

Q. What exactly is "Colloidal Silver?"

A. Colloidal Silver is a liquid solution containing microscopic particles of pure silver permanently suspended in de-ionized water.

---

Q. How does Colloidal Silver work?

A. According to Doctors Colloidal Silver inhibits the ability of disease-causing organisms such as bacteria, virus, fungus, and parasites from assimilating oxygen, and as a consequence, they literally suffocate and die.

---

Q. Why can't these disease-causing organisms mutate into other forms and become immune to Colloidal Silver much the same as they do with antibiotics such as penicillin?

A. In accordance to Doctor ... since the Colloidal Silver is a nontoxic product and in the literal sense doesn't "kill" any bacteria or other pathogen, there is nothing from which to become immune; it merely disables the "germs" ability to assimilate oxygen and as a result, the germ dies.

---

Q. What is the main difference between Colloidal Silver and conventional medicines such as penicillin and antiviral drugs?

A. The principal difference is the fact that conventional or traditional antibiotics are toxic chemicals (pharmaceuticals) that actually "kill" the bacteria, as opposed to Colloidal Silver being nontoxic and unable to "kill" any bacteria, acting only in a manner that prevents the "germ" from assimilating oxygen and as a result, the germ suffocates and dies. Also, Colloidal Silver is nontoxic and has no known adverse side effects associated with prescription drugs.

---

Q. May Colloidal Silver be used on infants and small children?

A. Many physicians use Colloidal Silver both infants and small children, either internally or topically. It is especially useful on eyes, since it is non-burning, non-stinging, and non-irritating. It is totally safe around children and no "child proof caps" are required; it is also good for diaper rash, burns, or other skin irritations.

---

Q. Since Colloidal Silver is effective on virtually all types of bacteria and virus, once it is consumed will it also be effective in destroying the good bacteria contained in the digestive tract and colon?

A. Yes, it will have an effect on destroying some of the good bacteria in the digestive tract. However, since it is in contact for only a very short period of time with these colonies of bacteria contained in the digestive tract, it will not be totally effective in destroying all of the good bacteria. We do however, suggest that anyone taking a substantial amount of Colloidal Silver internally, supplement it with some good bacteria (such as acidophilus and Probiotics) available through local health food stores and some pharmacies.

---

Q. Why should we take Colloidal Silver in the strength of 30 parts per million, as opposed to some which is sold in strengths of 5, 10, 50, 500, etc.?

A. The research which has been conducted on various disease causing organisms revealed a significant difference in the "kill rate" on strengths up to 25 ppm, but no significant difference

over 25 ppm. Consequently the 30ppm strength is the optimum strength to use on virtually any application.

---

Q. Will Colloidal Silver react or interact with any medicine?

A. There is no evidence, nor has the U. S. Center for Disease Control (CDC) in Atlanta ever received any report of any type of adverse reaction from Colloidal Silver used in combination with any drug.

---

Q. What is the shelf life of Colloidal Silver ?

A. There are reports of product made 150 years ago and still retaining the same potency.

---

Q. Can Colloidal Silver be used to purify water?

A. Reports of various agencies report that colloidal silver will virtually eliminate all types of bacteria viruses/germs; and we have a chart with recommended amounts to be added to water. The water must also be filtered in some way (activated charcoal and/or DI, for instance) and cleaned before human consumption, but SilverKare Colloidal Silver will eliminate most, if not all pathogens/germs. We recommend using a charcoal filter to remove bad taste.

---

Q. Can SilverKare Colloidal Silver be used for pets?

A. Yes. Since it is tasteless, it may be added to household pets drinking water. It may also be applied topically on any part of the animal, without fear of burning, stinging, or irritation. To learn more about how a Houston veterinarian uses Colloidal Silver with animals [click here](#).

Note: We make no claims whatsoever as to the rate of healing, or effectiveness of these products on any particular individual. The products described herein are not intended to replace the recommendation of a physician. We suggest that you consult your local health care professional in the event of illness / disease.
